cable head-end

DEFINITION - A cable head-end (or headend) is the facility at a local cable TV office that originates and communicates [cable TV](#) services and [cable modem](#) services to subscribers. In distributing cable television services, the head-end includes a satellite dish [antenna](#) for receiving incoming programming. This programming is then passed on to the subscriber. (Cable TV companies may also play videotapes and originate live programming.) Normally, all signals are those that are sent [downstream](#) to the subscriber, but some are received upstream such as when a customer requests a [pay-per-view](#) program.

When a cable company provides Internet access to subscribers, the head-end includes the computer system and databases needed to provide Internet access. The most important component located at the head-end is the cable modem termination system ([CMTS](#)), which sends and receives digital cable modem signals on a cable network and is necessary for providing Internet services to cable subscribers.

IN THE CLAIMS:

Please cancel claims 1-32, and add the following new claims:

Sub C1 } --33. A transmission system for providing information to be transmitted to remote locations, the transmission system comprising:

a plurality of electronically connected library means for storing items containing information;

identification encoding means for retrieving the information in the items from the plurality of library means and for assigning a unique identification code to the retrieved information;

conversion means, coupled to the identification encoding means, for placing the retrieved information into a predetermined format as formatted data; and

b-2 Contd } transmitter means, coupled to the conversion means, for transmission of the formatted data to one of the remote locations.

34. A transmission system as recited in claim 33, wherein the plurality of libraries are geographically separated.

Sub C2 } 35. A digital audio/video communication network comprising:

a local reception system comprising:

means for receiving compressed, digitized data representing at least one item of audio/video information at a non-real time rate,

means for storing a complete copy of the received compressed, digitized data, and

means, responsive to the stored compressed, digitized data, for transmitting a representation of the at least one item of audio/video information at a real-time rate to at least one of a plurality of subscriber receiving stations coupled to the local reception system.

36. A digital audio/video communication network as recited in claim 35, wherein the means for transmitting comprises a converter for decompressing the compressed digitized data representing the at least one item of audio/video information.

37. A digital audio/video communication network as recited in claim 35, further comprising a processing station for formatting items of audio/video information as compressed, digitized data and transmitting the compressed, digitized data representing at least one item of audio/video information at the non-real time rate to the means for receiving.

38. A digital audio-video communication network as recited in claim 37, wherein the processing station comprises:

means for inputting items of audio/video information; conversion means for placing each input item of audio/video information into a predetermined format as formatted data; compression means for compressing the formatted data; and transmitter means for sending compressed formatted data for the at least one item of audio/video information at the non-real time rate to the local reception system.

4637 39. A method of distributing audio/video information comprising:

transmitting compressed, digitized data representing a complete copy of at least one item of audio/video information at a non-real time rate from a central processing location;

receiving the transmitted compressed, digitized data representing a complete copy of the at least one item of audio/video information, at a local distribution system remote from the central processing location;

storing the received compressed, digitized data representing the complete copy of the at least one item at the local distribution system; and

in response to the stored compressed, digitized data, transmitting a representation of the at least one item at a real-time rate to at least one of a plurality of subscriber receiving stations coupled to the local distribution system.

40. A method as recited in claim 39, further comprising the step of decompressing the compressed, digitized data representing the at least one item of audio/video information before the transmission at a real time rate.

41. A method as recited in claim 40, wherein the decompressing step is performed in the local distribution system to produce the representation of the at least one item for transmission to the at least one subscriber station.

42. A method of distributing audio/video information comprising:

formatting items of audio/video information as compressed digitized data at a central processing location;

transmitting compressed, digitized data representing a complete copy of at least one item of audio/video information from the central processing location;

receiving the transmitted compressed, digitized data representing a complete copy of the at least one item of audio/video information, at a local distribution system;

storing the received compressed, digitized data representing the complete copy of the at least one item at the local distribution system; and

using the stored compressed, digitized data to transmit a representation of the at least one item to at a plurality of subscriber receiving stations coupled to the local distribution system.---

REMARKS

The amendments to the specification were made in the parent application S.N. 08/133,982 to correct minor typographical and grammatical errors. Claims 1-32 have been cancelled and new claims 33-42 have been added. New claims 33-42 correspond to proposed amended claims 33, 34, 48-54, and 58 of the parent application.

Claims 33-42 define patentable subject matter as set forth in the first Amendment After Final filed in the parent application. That amendment was not entered in the parent application.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371 of this title before the invention thereof by the applicant for patent.

2. Claims 33 and 34 are rejected under 35 U.S.C. 102(e) as being anticipated by Wilson et al.

Wilson et al discloses an interactive multimedia presentation and communication system comprising the following subject matters of the claimed "transmission system for providing information to be transmitted to remote locations": "a plurality of electronically connected library means" (Fig. 1, LOC 24, Fig. 2, Fig. 10) "being geographically separated" (claim 34) (col. 10, lines 35-42), "identification encoding means" (Fig. 10, element 162, col. 38, lines 37-46), "conversion means" (col. 39, lines 1-18), "transmitter means" (Fig. 10, element 168, 169).

3. Claims 35-42 are rejected under 35 U.S.C. 102(e) as being anticipated by Tindell et al.

Regarding claims 35, 36, Tindell et al discloses a store and forward video system comprising the following subject matters of the claimed "digital audio/video communication network": "a local reception system" (Fig. 5), "means for receiving compressed, digitized data" (Fig. 5, elements 64, 66,

Art Unit:

68, 70, 74), "means for storing a complete copy" (Fig. 5, element 78, col. 5, lines 29-32), "means responsive to the stored compressed, digitized data, for transmitting" (Fig. 5, elements 82, 84, 86, 88), "converter for decompressing" (claim 36) (Fig. 5, element 82).

Regarding claim 37, Tindell et al also discloses the claimed "a processing station for formatting items of audio/video information" (Fig. 1, element 10, Fig. 2 and Fig. 3).

Regarding claim 38, Tindell et al further discloses the following subject matters comprised in the claimed "processing station": "means for inputting" (Fig. 3, element 24), "conversion means" (Fig. 3, elements 32, 34, , 36, 40, 42), "compression means" (Fig. 3, element 44), "transmitter means" (Fig. 2, element 30).

Regarding claims 39-41, Tindell et al discloses the following subject matters of the claimed "method of distributing audio/video information": "transmitting compressed, digitized data..." (Fig. 6), "receiving the transmitted compressed, digitized data" (Fig. 7, 118), "storing the received compressed, digitized data" (Fig. 7, 122), "in response to the stored compressed, digitized data, transmitting a representation of the at least one item" (Fig. 7, 124, 126), "the step of decompressing" (claims 40, 41) (Fig. 7, 124).

Regarding claim 42, Tindell et al discloses the following subject matters of the claimed "method of distributing audio/video information": "formatting items of audio/video information" (Fig. 6, 90, 92), "transmitting compressed, digitized data representing a complete copy" (Fig. 6, 108), "receiving the transmitted compressed, digitized data" (Fig. 7, 118), "storing the received

Art Unit:

compressed, digitized data" (Fig. 7, 122), "using the stored compressed, digitized data to transmit a representation of the at least one item" (Fig. 7, 126).

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Paolini discloses a system with two different communication mediums, transmitting retrieved video and compressed audio information to plural receivers responsively to users' requests.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Amanda Le whose telephone number is (703) 305-4769. The examiner can normally be reached on Tuesday-Friday from 7:30 AM to 5:00 PM. The examiner can also be reached on alternate Mondays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Chin, can be reached on (703) 305-4714.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 305-3900.

Any response to this action should be mailed to:

COMMENTS:

REMINDER

Drawing changes may also require changes in the specification, e.g., if Fig. 1 is changed to Fig. 1A, Fig. 1B, Fig. 1C, etc., the specification, at the Brief Description of the Drawings, must likewise be changed. Please make such changes by 37 CFR 1.312 Amendment at the time of submitting drawing changes.

INFORMATION ON HOW TO EFFECT DRAWING CHANGES

1. Correction of Informalities—37 CFR 1.85

File new drawings with the changes incorporated therein. The application number or the title of the invention, inventor's name, docket number (if any), and the name and telephone number of a person to call if the Office is unable to match the drawings to the proper application, should be placed on the back of each sheet of drawings in accordance with 37 CFR 1.84(c). Applicant may delay filing of the new drawings until receipt of the Notice of Allowability (PTOL-37). Extensions of time may be obtained under the provisions of 37 CFR 1.136. The drawing should be filed as a separate paper with a transmittal letter addressed to the Drawing Review Branch.

2. Timing of Corrections

Applicant is required to submit acceptable corrected drawings within the three-month shortened statutory period set in the Notice of Allowability (PTOL-37). If a correction is determined to be unacceptable by the Office, applicant must arrange to have acceptable correction resubmitted within the original three-month period to avoid the necessity of obtaining an extension of time and paying the extension fee. Therefore, applicant should file corrected drawings as soon as possible.

Failure to take corrective action within set (or extended) period will result in ABANDONMENT of the Application.

3. Corrections other than Informalities Noted by the Drawing Review Branch on the Form PTO 948

All changes to the drawings, other than informalities noted by the Drawing Review Branch, MUST be approved by the examiner before the application will be allowed. No changes will be permitted to be made, other than correction of informalities, unless the examiner has approved the proposed changes.

AMENDMENT

Sir:

In response to the July 24, 1997 Office Action, please consider the following

Remarks:

REMARKS

In the Office Action, the Examiner rejected claims 33 and 34 under 35 U.S.C. § 102(e) as anticipated by U.S. Patent No. 5,195,092 issued to Wilson et al. The Wilson et al. patent discloses an interactive multimedia presentation and communication system. More specifically, Wilson et al. teaches an "electronic shopping mall" in which a subscriber tunes his television to a particular channel,

telephones a local number, follows log-on instructions given over the telephone, and then uses the touch-tone keypad of his telephone to navigate through an electronic information system that displays multimedia presentations in the form of video images and accompanying audio on various items selected by the subscriber. See col. 1, lines 19-37. When the shopper chooses to terminate a shopping session, he simply hangs up his phone. The hang-up signal is routed to the session server and a termination script is sent to the subscriber. System resources can then be assigned to a subsequent shopper. See col. 30, lines 19-35.

Wilson et al. teaches a system significantly different from the present invention. For example, Wilson et al. requires that the shopper be connected to the system resources by telephone for the duration of the transaction. This limits both telephone use by the subscriber as well as the availability of system resources to other subscribers. Furthermore, in Wilson et al. the subscriber is required to be physically present at the location to which information is transmitted.

In contrast, the present invention provides a flexible system in which a user can remotely access information. That is, the user can request transmission of information to a site remote from the requesting site. Additionally, with the present invention the user does not have to be connected by telephone when information is transmitted from the library to the selected remote location. This frees up system resources for use by others and makes the system much more convenient to use than that disclosed in Wilson et al.

The Examiner next rejected claims 35-42 under 35 U.S.C. § 102(e) as by U.S. Patent No. 5,130,792 issued to Tindell et al.

The Tindell et al. patent discloses a store and forward video system. According to Tindell et al., data from a central data facility 10 is transmitted over telephone network 12 to a receiving unit 16. Fig. 5 of Tindell et al. discloses the details of the receiving unit 16, which, according to Tindell et al., is at a remote location. The receiving unit 16 receives information from the telephone network and ultimately stores the information in a mass storage device 78. The data is stored in the mass storage device 78 in a compressed format and is stored until the entire requested program is downloaded from the central data facility 10. According to Tindell et al., the mass storage device 78 is preferably an erasable optical disk or other similar high density storage medium. When a viewer selects the play mode, the control unit 72 causes the data stored in the mass storage device 78 to be transferred through storage interface 76 to data decompression unit 82. The signal is A/D converted and reconstructed and then the composite video signal is output for viewing.

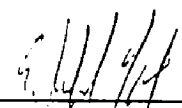

As is clear from Tindell et al., the receiving unit 16 at the user premises contains the mass storage device 78 and stores the compressed programming for viewing after decompression and processing. In contrast, according to the present invention, the compressed data is stored at a local reception system (claim 35) or a local distribution system (claims 39 and 42). The compressed data is stored at the

local facility and is sent at a real time rate to a subscriber receiving station. Use of a local reception or distribution system is neither taught nor suggested by Tindell et al. and such a system considerably simplifies and reduces the cost of the components required at the user end. That is, by storing the requested compressed information locally, the subscriber does not need to have compressed data storage or decompression circuitry at his location. Rather, a local facility can have these elements and they can be distributed or shared between a plurality of users in a local region.

If there are any other fees due in connection with the filing of this Amendment, please charge the fees to our Deposit Account No. 06-0916. If a fee is required for an extension of time under 37 C.F.R. § 1.136 not accounted for above, such an extension is requested and the fee should also be charged to our Deposit Account.

Respectfully submitted,

repulsion-induction motor A motor with repulsion-motor windings and short-circuited brushes, without an additional device for short-circuiting the commutator segments, and with a squirrel-cage winding in the rotor in addition to the repulsion motor winding.

(PE) [9]

repulsion motor A single-phase motor that has a stator winding arranged for connection to a source of power and a rotor winding connected to a commutator. Brushes on the commutator are short-circuited and are so placed that the magnetic axis of the rotor winding is inclined to the magnetic axis of the stator winding. This type of motor has a varying-speed characteristic. *See also*: asynchronous machine.

(PE) [9]

repulsion-start induction motor A single-phase motor with repulsion-motor windings and brushes, having a commutator-short-circuiting device that operates at a predetermined speed of rotation to convert the motor into the equivalent of a squirrel-cage motor for running operation. For starting operation,

this motor performs as a repulsion motor. *See also*: asynchronous machine.

(PE) [9]

request (1) Transaction that is generated by a requester, to initiate an action on a responder. For a processor-to-memory read transaction, for example, the request transfers the memory address and command from the processor to memory. In the case of a split transaction, the request would be a separate bus transaction. In the case of a connected transaction, the request would be the connection phase of a bus transaction.

(BA/C) 896.3-1993

(2) A type of primitive in which one layer entity solicits another layer entity to perform a particular function.

(EMB) 1073.3.1-1994, 1073.4.1-1994

(3) (Request_Normal, Request_High) A link control signal indicating that a lower entity has traffic pending for the network.

(C/LM) 802.12-1995

(4) A command, generated by a requester, to initiate an action on a responder. For a processor-to-memory read transaction, for example, the request transfers the memory address and command from the processor to memory. In the case of a split transaction, the request would be a separate bus transaction. In the case of a connected transaction, the request would be the connection phase of a bus transaction.

request for proposal A document used by the acquirer as a means to announce intention to potential bidders to acquire a specified system or software product (which may be part of a system).

(C/SE) 1062-1993

requester-capable A term used to describe RamLink slaves that behave as DMA masters in the sense that they generate request packets and receive response packets. The delivery of these request and response packets is done by the controller.

(C/MM) 1596.4-1996

requested batch service A service that is either rejected or performed prior to a response from the service to the requester.

(C/PA) 1003.2d-1994

requester (1) (VSB) A functional module that resides on the same board as a master and requests use of the DTB whenever its master needs it. When implementing serial arbitration, after requesting use of the DTB, the requester waits for the bus to be granted to it by the arbiter. In the parallel arbitration method, the requester that is associated with the active master initiates an arbitration cycle. This arbitration cycle is used to determine which master will be granted use of the DTB. The VSB specification calls the requester that is associated with the master the "active requester." Requesters that have a bus request pending and that participate in an arbitration cycle are called "contending requesters."

(C/MM) 1096-1988

(2) (VMEbus) A functional module that resides on the same printed-circuit board (pcb) as an interrupt handler or a master and requests use of the data transfer bus (DTB) whenever its interrupt handler or master needs it.

(BA/C) 1014-1987

(3) A module that initiates a transaction by sending a request (containing address, command, and sometimes data).

(BA/C) 1014.1-1994, 10857-1994, 896.3-1993,

896.4-1993

(4) The node that initiates a transaction, by initiating a request subaction.

(C/MM) 1596-1992

(5) A node that initiates a transaction by generating a request subaction (containing address, command, and sometimes data).

(C/MM) 1212-1991s

requesting agent An agent that has entered arbitration for bus access. *See also*: arbitration operation.
